

## Recommendations for Human Immunodeficiency Virus (HIV) Screening in Tuberculosis (TB) Clinics

### What are the recommendations for human immunodeficiency virus (HIV) screening in tuberculosis (TB) clinics?

In revised recommendations from 2006, CDC recommends HIV screening for all TB patients after the patient is notified that testing will be performed, unless the patient declines (i.e., opt-out screening). Routine HIV testing is also recommended for TB suspects and contacts to TB patients. Persons at high risk for HIV infection should be screened for HIV at least annually. Separate written consent and prevention counseling for HIV testing should no longer be required.

### How do the new 2006 recommendations for HIV screening differ from previous ones?

These recommendations address health care settings only and do not replace previous recommendations for HIV testing in non-clinical, outreach, or field settings. They aim to eliminate missed opportunities for HIV screening and reduce significant barriers to HIV testing in health care settings by:

- Using opt-out HIV screening.
- Screening persons at high risk for HIV annually.
- Eliminating the need for separate written consent for HIV testing.
- Eliminating the need for prevention counseling as part of HIV testing.

### What is opt-out screening?

Opt-out screening is defined as performing HIV testing after notifying the patient that the test will be performed and that although the patient may decline or defer testing, it is strongly recommended. Assent is inferred unless the patient declines testing.

### Why does CDC recommend that TB clinics screen their patients for HIV infection?

HIV infection is the most important known risk factor for progression from latent TB infection to TB disease. Progression to TB disease is often rapid among HIV-infected persons and can be deadly. In addition, TB outbreaks can rapidly expand in HIV-infected patient groups.

Targeted testing based on provider assessment of patient risk behaviors fails to identify a substantial number of persons who are HIV-infected. This is because many individuals may not perceive themselves to be at risk for HIV or do not disclose their risks. Routine HIV testing reduces the stigma associated with testing. When HIV is diagnosed early, appropriately timed interventions can lead to improved health outcomes, including slower progression and reduced mortality. Identifying TB patients, suspects, and contacts who are HIV-infected allows for optimal TB screening of these groups and opportunities to prevent TB in those without disease.

### Who should be tested for HIV in TB clinics?

All patients should be tested for HIV. This includes TB suspects, patients, and contacts.

### Can rapid HIV tests be used to screen TB patients and their contacts?

Yes. Rapid HIV tests, using fingerprick or oral specimens, can be used. Results are available in about 20 minutes. Although the rapid HIV test kits cost about \$10 more per test than standard lab assays, they have been shown to be cost-effective and to increase patients' acceptance of HIV testing. Another option is to collect oral swab specimens and use standard lab assays.

## What education and training resources on HIV counseling and testing are available?

Resources for education and training on HIV counseling and testing are available from CDC-funded HIV/AIDS programs in each state health department and from the National Network of STD/HIV Prevention Training Centers . Additionally, the Health Resources and Services Administration (HRSA) has regional AIDS Education and Training Centers (AETCs) and other local performance sites that can provide training in HIV counseling and testing to TB staff.

Also available is a Contact Investigation and Management Protocol to facilitate HIV counseling, testing, and referral during TB contact investigations. The protocol was developed by the New York City Bureau of TB Control, in collaboration with the New York City Department of Health HIV Training Institute, with funding from CDC.

## [ Tuberculosis: The Connection between TB and HIV (the AIDS Virus) ]

### Abstract

This brochure explains TB and its connection with HIV/AIDS. It discusses TB transmission and describes the symptoms of TB and pulmonary TB

### Available From

**Asian Pacific Health Care Venture Inc**

1530 Hillhurst Ave Ste 200

Los Angeles, CA 90027

Main Phone: (323) 644-3880

<http://aphcv.apanet.org>

### Format

Brochure/Pamphlet

### Physical Description

1 folded sheet (6 p.): mono, ill.

### Language

Chinese

### Country of Origin

United States

### Audiences

Asians/Pacific Islanders, **Foreign-born/Immigrant**, Persons With HIV/AIDS, Persons With LTBI, Persons With TB

### Document URL

PDF:
